

## **T-Systems Cloudifier – easing the burden of transitioning to the cloud**

*The first step of your digital transformation journey*

How we use and consume services has changed significantly over the past few years. The Internet, Mobility, Smartphones and more have given rise to new ways of interacting and transacting with businesses. Coupled with increasing customer expectations, fuelled by a mobile generation, and the need to differentiate with an enhanced customer experience, companies are having to digitise their environment. Migrating to the cloud is the first phase in the journey of digital transformation and T-Systems helps you take that first critical step with its Cloudifier service.

CIO's dread the prospect of such an exercise as it is usually fraught with complexity and budget overruns. However, with Cloudifier, T-Systems simplifies this process and caps costs whilst guaranteeing a reduction of 20% in the Total Cost of Ownership.

The success of Cloudifier hinges off a consultative approach in order to understand your business and IT landscape along with your digital assets. Importantly, T-systems aligns this with your business strategy, creating an IT strategy that links into business outcomes.

There are three phases in the process of migrating your applications to the cloud:

- **Design** – T-Systems delivers a consultancy service to understand all your digital assets and business strategy. ***T-Systems does this at absolutely no cost.*** This demonstrates our confidence in our tools and methodology.
- **Transform** – we create a roadmap.
- **Operate** – we transition to the cloud.

What is unique about this service is that it is packaged in varying degrees of complexity (low, medium and high) with a fixed price tag.

Hear more about how T-Systems is changing the status quo at its 'In Touch' customer event, to be held on the 12th of May 2016 in Johannesburg and the 19th of May 2016 in Cape Town, where its disruptive approach to business and technology will be demonstrated and discussed.
